KWC ONO E

Understated
elegance

Pure stainless steel aesthetics

KWC ONO E – stainless-steel fittings in delicate perfection for the premium bathroom.

Slimmer than any other KWC bathroom fitting. Clear lines, high-quality materials, refined down to the last detail and a pleasure for all the senses: the quality of the design matches the quality of the construction. The KWC ONO E is made of pure stainless steel with a brushed or chrome-plated surface, which together ensure complete hygiene. The sleek design is complemented by the durable construction – a tap that adds a brilliant touch to any premium bathroom.

KWC ONO E

Understated elegance

Beautiful in detail

The radial brushing emphasises the curved character of the tap. The fine workmanship and minimal gap widths are also testament to the attention to detail. This makes even the largest version appear light and elegant. A timeless design.

Effortlessly sleek

The KWC ONO E in stainless steel is already a design classic, and with a diameter of 35 mm, slimmer and more elegant than ever before. Whether with a chrome-plated or brushed finish, this is a stylish premium product from the KWC brand.

Delicate throughout

The operating lever does not require a recess. Slightly bevelled surfaces on the lever and spout emphasise the airiness of the design.

KWC ONO E

Functional purity

More hygiene

An aerator for greater hygiene. The aerator can be adjusted by 7° in all directions. Less splashing water means easier cleaning and better hygiene.

More space

The operating lever hovers directly above the washbasin. This helps to avoid water and limescale residues outside the washbasin. The result is cleanliness and plenty of space for your hands

More movement

Plenty of hand clearance with low overall height. The special design enables convenient operation and adapts to requirements. The swivel spout has a radius of 120° and can alternatively also be fixed.

Mobile and practical

The aerator is adjustable and almost invisible. For cleaning, simply unscrew and descale separately. The characteristically tall, arched lever mixer provides great freedom of movement in the basin and sets visual highlights in the bathroom

Versatile and durable

The KWC ONO E is a complete range with a variety of options for every application in the premium bathroom. Everything is exquisitely finished and seamlessly rounded. Quality and durability are absolutely top class thanks to the high-quality stainless steel.

KWC ONO E

Highlights of the features

Intuitive and elegant

A switch button for the spout and handheld shower directly on the mixer ensures effortless operation. Functional and streamlined – stylish down to the last detail.

Natural and safe

The cascade spout acts like a small waterfall in the bath. It's easy to clean. The design and mounting help to prevent unintentional impact with your body.

KWC ONO E

Data for the future

High quality and sustainable

High-quality and sustainable V4A stainless steel. The highest grade of stainless steel. It provides no breeding ground for bacteria. Durable and recyclable, it is considered particularly sustainable. Additionally, water leaches out significantly fewer heavy metals from stainless steel than from other metal pipes.

Innovative simplicity

Simple control via optoelectronic sensor. The solid stainless-steel housing in a minimalist design requires no joints, gaps or seals – ideal for maximum hygiene and easy cleaning.

Individual and digital

Digital control guarantees simple data flow. Tips on optimising the use of the tap make it easier to save water, facilitate servicing and increase the service life of the tap. A fitting that adapts perfectly to any setting.

KWC Smart Connect app

Up to 100 fittings can be managed securely with the KWC Smart Connect app, as they are password-protected. Individual settings such as water flow time or sensor range can be parameterised.

Modular system

What we call the connectivity module (C module) enables the fitting to be controlled and parameterised independently of the power supply via battery or mains adapter.

The direct connection between the fitting and the app

The C module provides the connection between the fitting and the app. It can be connected directly to the tap cable under the washbasin using a clip integrated into the module housing.
